

Para-MagTM Collimating Magnifier

TOBIAS
ASSOCIATES, INC.

The **Para-MagTM**, the collimating magnifier for the Graphic Arts, eliminates parallax. The error of eye position or parallax can spell the difference between good or poor register. **Para-Mag** will eliminate that problem. In using the photo composing machine many printers require that, for critical register, a plate be printed completely by one person. Since each platemaker by virtue of height or personal technique looks at a line up mark differently in locking up the chase, the **Para-Mag** can eliminate this difference by requiring that each operator look at the marks the proper way — at a right angle to the film surface. The achromatic optics that are used help to eliminate fatigue that may occur when using a magnifier a good portion of the day. The contrasting sighting rings when visually centered indicate that the eye is exactly at a right angle to the surface. The light diffusing plastic that allows its use with negatives where the amount of light reaching the lens is low. The bottom surface of the **Para-Mag** is shaped to prevent suction if used in wet stripping.

Features:

- 7X or 10X Power Magnifier
- Plastic barrel allows for low amount of light
- The bottom shape prevent suction.
- Easy to position barrel for sharp focusing
- View registration marks on plates
- Check dots on digital plates to insure they are not corrupted
